WPI; 1999-120776/10.

New glycosylated soluble IL-6 receptor/IL-6 conjugates - used treating cancers, bone marrow transplantation, increasing haem or treating liver or neurological disorders. used for e.g. haematopoiesis

Claim 6; Fig 3; 77pp; English.

RESULT 1
AAY03164
ID AAY03164
AAY 03464
AAY 03 This sequence represents the chimeric glycosylated soluble interleukin-6 receptor (sII-6R)-interleukin-6 (II-6) protein (sII-6R/II-6) of the invention. It comprises a fusion protein product between all of the naturally occurring form of sIL-6R and all of the naturally occurring form of II-6, the sIL-6/II-6 and analogues being glycosylated in a similar fashion to the glycosylation of naturally occurring sII-6R and III-6. The sIL-6/II-6 and analogues are capable of inhibiting the growth of highly malignant cancer cells, e.g. melanoma cells, eliciting the in vivo

                                                                                                                                                                                                                                                                                                                         D,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is the protein sequence of a novel fusion protein CC comprising a soluble form of the human interleukin-6 receptor, denoted DS CC -sIL-6R (see also ABP72698), joined via a peptide linker to a human IL-6 cm of comprising a soluble form of the human interleukin-6 receptor, denoted DS CC administration of this fusion protein results in the increased expression of one or more of MIP-lalpha, MIP-lbeta, RANTES or IP-10. High levels of CC MIP-lalpha, MIP-lbeta, MIP-beta, RANTES or IP-10. High levels of CC and effectively suppress HIV entry. The fusion protein can be used in the treatment of any disease in which the infectious agent binds to CCR5, cespecially M-trophic strains of HIV. The invention also provides a complete acid molecule encoding the fusion protein, an expression vector, a host cell, and a method of producing the fusion protein in the host cell. The fusion protein, nucleic acid or vector can be used in the colling construction of a medicament for the prophylaxis or treatment of an infectious disease (especially AIDS caused by a M-trophic strain of HIV, cor bacterial peritonitis), an inflammatory disorder or an immunological cor bacterial peritonitis), an immune response (claimed)

The invention relates to the production of a fusion protein comprising the human interleukin 6 receptor (IL-6R) fused to the human IL-6 protein in a Pichia pastoris yeast cell. This sequence represents the IL-6R/IL-6 fusion protein. The coding sequence for this protein is cloned into an expression vector for introduction into P. pastoris. The IL-6R protein is used as a drug for amplifying myeloid stem cells and increasing platelets
                                                                                                                                                      Yeast of Pichia Pastoris genus transformed by expression vector containing gene encoding fused protein of interleukin-6 receptor (IL-6R) protein for amplifying myeloid stem cells and increasing platelets.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents the fusion polypeptide H-II-6 which contains a la amino acid linker which joins the carboxy terminus of human interleukin-6 (II-6). Such conjugates could be used to modulate interactions between proteins, particularly to overcome interrupted interactions caused by an incomplete interleukin-6 (II-6) receptor. The constructs derived from II-6 and its receptor, can also be used for exvivo expansion of human stem cells, and as a therapeutic II-6 receptor antagonist. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI;

                                                                                                                                                                           This sequence represents the fusion polypeptide H-IL-6 which contains a 13 amino acid linker which joins the carboxy terminus of human interleukin-6 receptor (IL-6R) with the amino terminus of human interleukin-6 (IL-6). Such conjugates could be used to modulate interactions between proteins, particularly to overcome interrupted interactions caused by an incomplete interleukin-6 (IL-6) receptor. The constructs derived from IL-6 and its receptor, can also be used for exvivo expansion of human stem cells, and as a therapeutic IL-6 receptor analysomist. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 2
                                                                                                           Sequence
                                                                                                                                                           antagonist.
